# ELMOS – Facts and a difficult start

- Based on BAMOS, but decision to develop own system was made very late
- BUT: AF and workflow was so different, that the system had to be adapted/ optimized
- implementation in June 2017 for project users
- difficulties in implementation: MA had to transfer the application forms and progress reports of 35 projects to the system

# ELMOS – Structure/ Tools

- Application form
- Reporting section
- Clarification lists
- Communication tool
- Payment section
- Task Manager
- Transfer of data from older PR and AF
- Checklists
- Clarification lists
- Status of check of PR report approval
- Task Manager
- Compare function

# Specials

## Concurrency Exception

- 2 user working at same time on the same site of the AF
- first user saves a made change
- second user changes something as well
- when second user is trying to save the new changes, a concurrency exception message is shown
- 2 options:
  - to keep the changes of user one
  - to save changes of user two

# Current challenges

- use of the system (high expectations, project managing tool)  
→ resistance, unacceptance to use it by all user groups
- budget: very detailed budget → navigation problems
- still adapting/ optimizing (communication tool) to our needs/ workflow
- still problems with projects and the change to the system

# How do we master the challenges?

- optimisation of usability
- workshop with all user groups and developer to define problems and find solutions → follow up → changes
- try to show the user groups, how the workflow/ processes behind the systems are
- budget changes
  - freezing columns in budget
  - possibility to change position of rows
  - optimising the size of rows/ columns
